Group 7: Michael Miranda & Binny Bajaj

Business Problem (*Subject to change/be altered):

"How can taxi/rideshare companies maximize revenue by understanding trip profitability?". This project would explore the business value of understanding how not all trips are equally profitable. A driver may experience high revenue, low revenue, and/or excess idle time depending on location and timing. By calculating fare amounts, tips, distance, trip duration, and/or revenue per mile across hundreds to thousands of trips, we are able to draw connections to the relevance of this course's objectives. Some analytics questions to ask may include, but are not limited to, "Which zones/areas generate the highest revenue?", Which periods/time of day generate the highest tips?", and/or "Which trips proved the highest revenue per minute?"
